

# Foodie web service

**Saraann Stanway, Srihari Shankar, Sam Azouzi, Heman Gandhi**

## How to use the client

Send a get request: `http://localhost:5000/?address=<the address here>`. This will geocode the address and then query zomato to grab nearby restaurants. You should see a JSON object with the key `restaurants` that has a list of restaurants as the value.

## Issues

Reading JSON is irritating.

## Libraries used

We run the service through Flask, python's simple web server library. We use the requests library to query the relevant APIs.

## How to start the service

```
pip install -r requirements.txt
python run.py
```

## Where are the keys

Lines 8 and 9 of `run.py`: they are just global variables.
